# FIT5192 Module 2

## Internet Applications Development

### Lecture 6

# Lecture Overview

1. Introduction
2. Master Pages
3. Themes and Skins

# Introduction

# Master Pages motivation

Designed in ASP.NET 2.0

Separates common page components of a website

Clearly identifies areas that change from page to page

An IDE like Visual Studio can help show the areas that are editable

When a user calls the page, the different parts -Master and page content are merged

# Partial Classes

Component partial classes merged

# Using Master Pages

A Master Page has the **Default** look of the website

- A **content place holder** shows where the variable content will be placed

```
<%@ Master Language="C#" %>
```

```
<html> <head runat="server"><title><title><head>
```

```
<body>
```

```
<h3>The Master page</h3>
```

```
<form id="form1" runat="server">
```

```
<asp:ContentPlaceHolder ID="ContentPlaceHolder1"  
    runat="server" />
```

```
</form>
```

```
</body> </html>
```

# The Content Page

The content page links to the Master page  
Has one or more content controls

```
<%@ Page Language="C#"      MasterPageFile="example.master"  
    Title="ASP.NET Master Page Example"%>
```

```
<asp:Content ID="Content1"  
ContentPlaceHolderID="ContentPlaceHolder1" runat="server">  
    <asp:Label ID="lbl1" runat="server" Text="This is the content page"/>  
</asp:Content>
```

## Multiple ContentPlaceholder's

# Master Page for Multiple ContentPlaceHolders

```
<%@ Master Language="C#" %>
<html> <head runat="server"> <title></title> </head>
<body>
<h3>The Master page</h3>
<form id="form1" runat="server">
  <asp:ContentPlaceholder ID="ContentPlaceholder1"
    runat="server" />
  <p /><hr />
  <asp:ContentPlaceholder ID="ContentPlaceholder2"
    runat="server" />
</form> </body></html>
```

# Content Page for Multiple ContentPlaceHolders

```
<%@ Page Language="C#" MasterPageFile="example0102.master"  
Title="ASP.NET Master Page Example"%>
```

```
<asp:Content ID="mainContent"  
ContentPlaceHolderID="ContentPlaceHolder1" runat="server">  
Main content. </asp:Content>
```

```
<asp:Content ID="footerContent"  
ContentPlaceHolderID="ContentPlaceHolder2" runat="server">  
Footer content. </asp:content>
```

## More Complex Master Pages

# Running the Head Tag at the Server

```
<head id="Head1" runat="server">  
  <title></title>  
</head>
```

In the Content Page

```
<%@ Page Language="C#"  
MasterPageFile="example0103.master"  
Title="Products"%>
```

# Adding EventHandlers

e.g.

```
void Page_Load(object sender, EventArgs e)
{
    litBannerTitle.Text = Page.Title;
    lblDate.Text = DateTime.Now.ToLongDateString();
}
```

# Laying Out Master Page with Table

## Laying Out Master Page with Table (Part1)

```
<table cellpadding="0" cellspacing="0">
<tr>
  <td class="bordertext" colspan="3" height="20"></td>
</tr>
<tr>
  <td class="bannertext"></td>
  <td class="bannertext">
    Bill n' Ben's Nursery<br />
    <asp:Literal ID="litBannerTitle" runat="server" />
  </td>
  <td class="bannertext">
    
  </td>
</tr>
```

## Laying Out Master Page with Table (Part2)

```
<tr>
  <td class="bordertext" colspan="3" height="20"></td>
</tr>
<tr>
  <td valign="top" class="bordertext" style="height: 340px">
    <asp:HyperLink ID="hl1" runat="server"
      NavigateUrl="products.aspx" Text="Products" />
    <p />
    <asp:HyperLink ID="hl2" runat="server"
      NavigateUrl="customers.aspx" Text="Customers" />
    <p />
    <asp:HyperLink ID="hl3" runat="server"
      NavigateUrl="orders.aspx" Text="Orders" />
  </td>
```

## Laying Out Master Page with Table (Part3)

```
<td colspan="2" style="height: 327px" valign="top">
<asp:ContentPlaceHolder ID="ContentPlaceHolder1" runat="server">
</asp:ContentPlaceHolder>
</td>
</tr>
<tr>
<td class="footertxt"> Copyright Bill n' Ben</td>
<td class="footertxt" align="right">
<asp:Label id="lblDate" runat="server" />
</td>
<td class="footertxt"></td>
</tr>
</table>
```

# Using the Master Page (with Table)

```
<%@ Page Language="C#" MasterPageFile="example0103.master"  
Title="Products"%>
```

```
<asp:Content ID="mainContent"  
ContentPlaceHolderID="ContentPlaceHolder1" Runat="Server">  
  <div class="mainpage">This is the products page</div>  
</asp:Content>
```

# Configuring the Master Page in the web.config

# If a site uses a single master File

It can be declared in the [web.config](#) file

```
<configuration>  
  <system.web>  
    <pages masterPageFile="~/MyMaster.master"/>  
  </system.web>  
</configuration>
```

## If the Master File has been declared in the web.config

Each page does not need to link to the Master file, so:

```
<%@ Page Language="C#" Title="Products"%>
```

Rather than:

```
<%@ Page Language="C#" MasterPageFile="example0103.master"  
Title="Products"%>
```

# Different Master Pages

Part of the Application can have different Master Pages

- Defined via the subdirectory

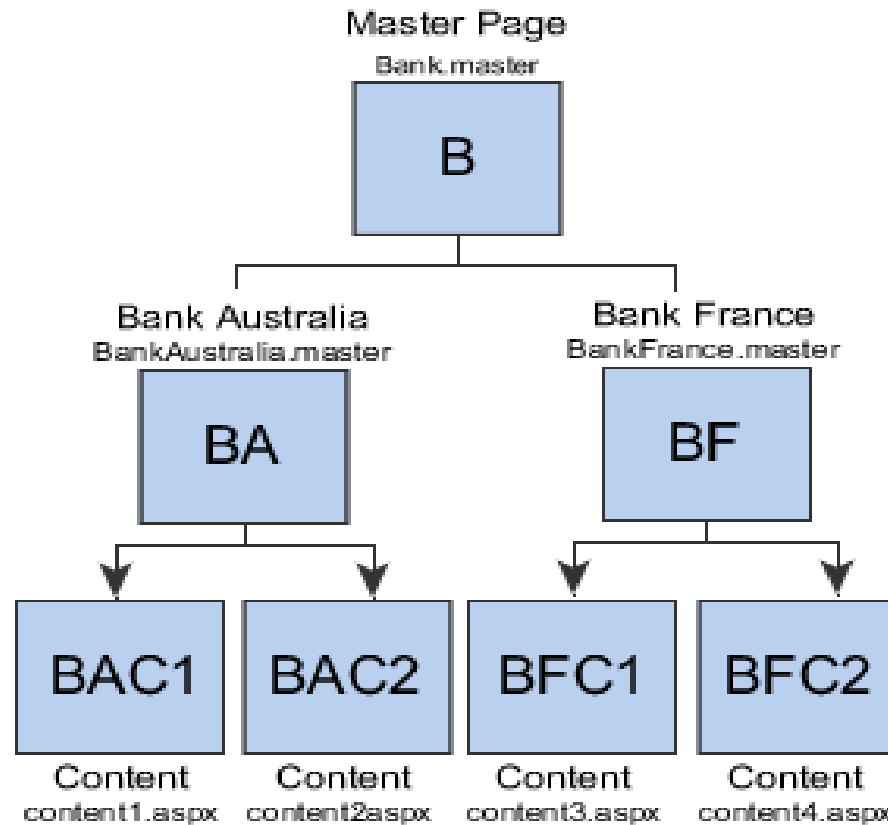

```
<configuration>
  <location path="Public">
    <system.web>
      <pages masterPageFile="~/MyPublicMaster.master" />
    </system.web>
  </location>
  <location path="Admin">
    <system.web>
      <pages masterPageFile="~/MyAdminMaster.master" />
    </system.web>
  </location>
</configuration>
```

# Nested Master files

# Most Companies have a Complicated Structure

National and then Local Divisions

Nested Master Pages can be used in these situations

# Themes

# Themes are used for consistency

Each **theme** can have different:

- Images
- Style sheets
- Skins
- Etc...

# Themes

- Blue
- Cherry
- Finance
- Morning
- Silver

## MORNING THEME

---

### Heading 1

Text

### Heading 2

Text

### Heading 3

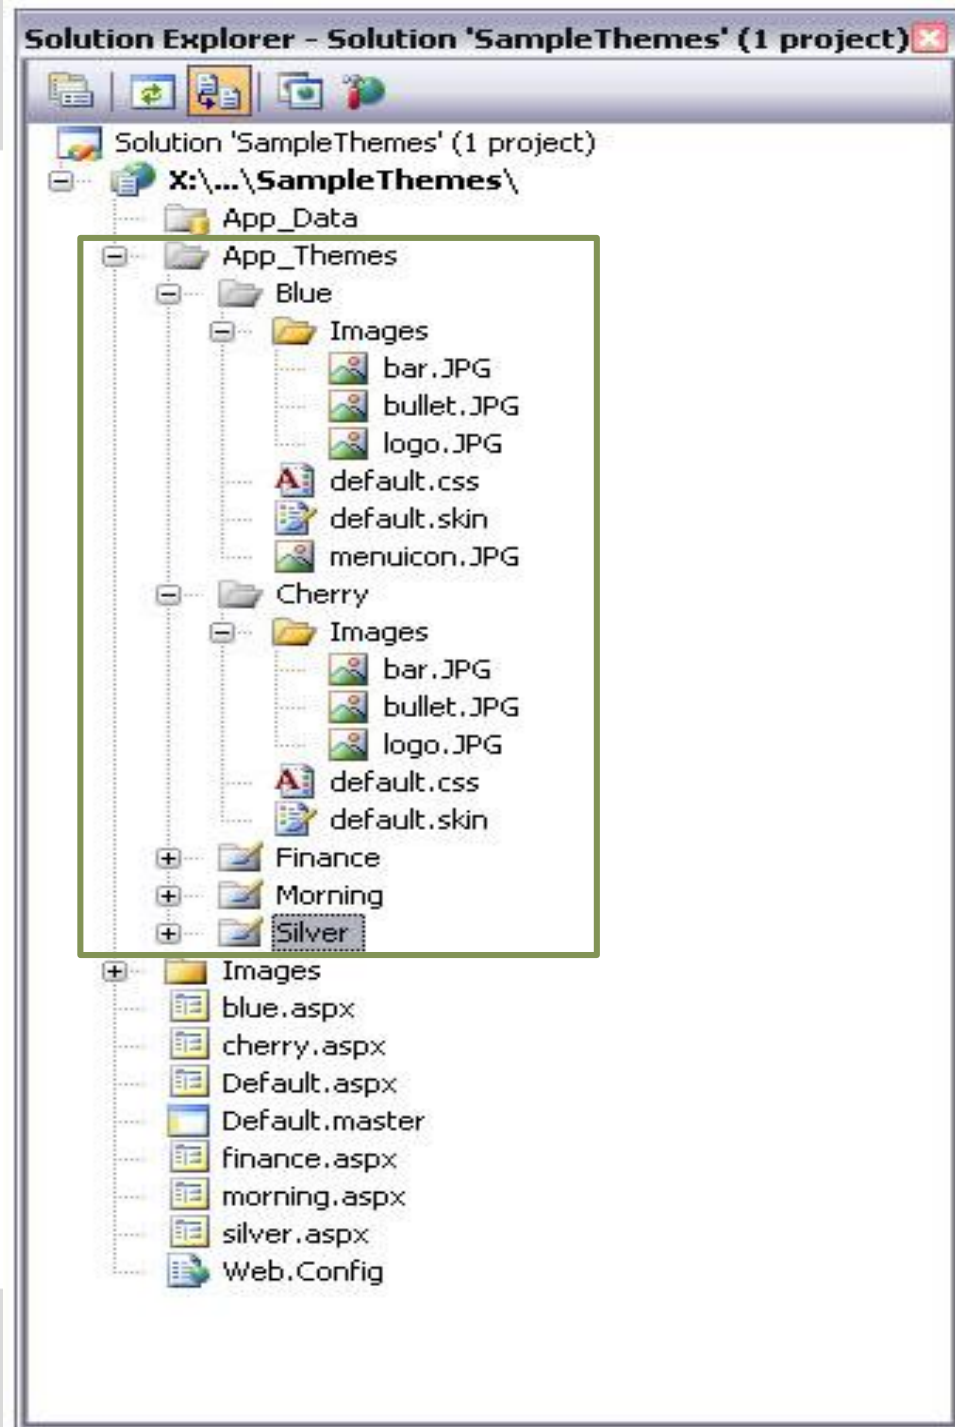

Text

### Sample Calendar

< May 2009 >						
Mo	Tu	We	Th	Fr	Sa	Su
27	28	29	30	1	2	3
4	5	6	7	8	9	10
11	12	13	14	15	16	17
18	19	20	21	22	23	24
25	26	27	28	29	30	31
1	2	3	4	5	6	7

# Theme File Structure

**App\_Theme** directory in the root folder of the application

# CSS and .SKIN files

CSS files are the cascading style sheet files

- These contain all the HTML layout definitions

SKIN files are like style sheets for the ASP controls

## **.skin** file for the silver theme (1)

```
<asp:image runat="server" Imageurl="Images/logo.jpg" skinid="logo" />
<asp:Calendar runat="server" SkinID="CalendarView"
    BackColor="White" BorderColor="#999999"
    CellPadding="4" DayNameFormat="Shortest" Font-Size="0.8em"
    ForeColor="Black" Height="180px" Width="200px">

    <SelectedDayStyle BackColor="#8C8EAA" Font-Bold="True"
    ForeColor="White" Font-Size="0.8em"/>
    <SelectorStyle BackColor="#8C8EAA" Font-Size="0.8em"/>
    <WeekendDayStyle BackColor="#F3F3F6" Font-Size="0.8em"/>
    <OtherMonthDayStyle ForeColor="#8C8EAA" Font-Size="0.9em"/>
```

## .SKIN file for the silver theme (2)

```
<TodayDayStyle BackColor="#D2D5DE" ForeColor="Black"  
Font-Size="0.8em"/>
```

```
<NextPrevStyle VerticalAlign="Bottom" Font-Bold="True"  
ForeColor="White" Font-Size="0.8em"/>
```

```
<DayHeaderStyle Font-Bold="True" Font-Size="0.8em"  
BackColor="#D2D5DE"/>
```

```
<TitleStyle BackColor="#8C8EAA" BorderColor="Black"  
Font-Bold="True" ForeColor="White" Font-Size="0.9em"/>
```

```
<DayStyle Font-Size="0.8em" />
```

```
</asp:Calendar>
```

# Using the Themes (1)

```
<%@ Page Language="C#"
    MasterPageFile="~/Default.master"
    StylesheetTheme="Silver" %>
<asp:Content ID="Content1"
    ContentPlaceHolderID="ContentPlaceHolder1"    Runat="Server">
    <br />
    <p class="title">Silver Theme</p>
    <br /><h1>Heading 1</h1>
    <p class="bodytextindent1">Text</p>
    <h2>Heading 2<br /></h2>
    <p class="bodytextindent1">Text</p>
```

## Using the Themes (2)

```
<h3>Heading 3</h3>
```

```
<p class="bodytextindent1">Text</p>
```

```
<h3>Sample Calendar</h3>
```

```
<br />
```

```
<asp:Calendar ID="Calendar1" runat="server"
```

```
    SkinID="CalendarView"/>
```

```
<br />
```

```
</asp:Content>
```

# StylesheetTheme or Theme

StylesheetTheme="Silver"

Theme="Silver"

If Theme is used it takes precedence

If StylesheetTheme is used,

- then any style set in the asp file takes precedence

# Theme Images

# Referencing images

In Master File:

```
<asp:Image ID="Image1" runat="server" skinid="logo"/>
```

In Theme .SKIN file:

```
<asp:image runat="server"  
    Imageurl="Images/logo.jpg"  
    skinid="logo" />
```

# Master Pages **don't** reference themes

Content pages reference the theme:

```
<%@ Page Language="C#"
```

```
    MasterPageFile="~/Default.master" Title="Untitled Page"
```

```
    StylesheetTheme="Silver"%>
```

Multiple skin options

## Multiple definitions of server controls (1)

```
<asp:Textbox Runat="server" ForeColor="#004000"  
  Font-Names="Verdana" Font-Size="X-Small"  
  BorderStyle="Solid" BorderWidth="1px"  
  BorderColor="#004000" Font-Bold="True" />
```

```
<asp:Textbox Runat="server" ForeColor="#000000"  
  Font-Names="Verdana" Font-Size="X-Small"  
  BorderStyle="Dotted" BorderWidth="5px"  
  BorderColor="#000000" Font-Bold="False"  
  SkinID="TextboxDotted" />
```

## Multiple definitions of server controls (2)

```
<asp:Textbox Runat="server"  
  ForeColor="#000000"  
  Font-Names="Arial" Font-Size="X-Large"  
  BorderStyle="Dashed" BorderWidth="3px"  
  BorderColor="#000000" Font-Bold="False"  
  SkinID="TextboxDashed" />
```

Server control without a skinID is the default

# Using multiple SkinID controls (Part1)

```
<%@ Page Language="C#" Theme="Summer" %>
<html xmlns="http://www.w3.org/1999/xhtml" >
  <head id="Head1" runat="server">
    <title>Different SkinIDs</title>
  </head>
  <body>
    <form id="form1" runat="server">
      <p>
        <asp:Textbox ID="TextBox1" Runat="server">
          Textbox 1 </asp:Textbox> </p>
```

## Using multiple SkinID controls (Part2)

<p>

<asp:Textbox ID="TextBox2" Runat="server"

**SkinId="TextboxDotted">Textbox 2 </asp:Textbox>**

</p>

<p>

<asp:Textbox ID="TextBox3" Runat="server"

**SkinId="TextboxDashed">Textbox 3</asp:Textbox>**

</p>

</form> </body> </html>

# Summary

1. Introduction
2. Master Pages
3. Themes and Skins

# What you will do in the Studio

Complete topic 6 exercises

Read ahead ASP examples from topic 7

Run using Visual Studio 2015/2017 and test some examples

MONASH  
University

Thanks and See you in the  
Studio!
