Additional notes on NeuroShell 2

The method of running the NeuroShell 2 tutes is as follows:

- Copy the folder C:\nshell2\examples into the C:\data folder
- Run NeuroShell 2 by selecting Programs->Neuroshell 2
- Open the specified example's .DSC file from the **C:\data\examples** folder. It is important that you open it from here only. The default location where the example files are located will not work and you will end up with windows that cannot be closed.
- Finish the example and close NeuroShell 2.
- Delete the C:\data\examples folder so that others will not go into trouble deleting these files later.

For your assignment, you would be OK if you create your project files in the C:\data folder. Remember to backup your data once you finish your session. Although you can work from your USB drive or U: drive, it is highly recommended that you use the C:\data folder instead because of the high I/O hit rate on the files by NeuroShell 2. You will find that working on the hard disk is much faster than working on the USB or U: drive.
